

Setting Up XLconnect Package on Windows

Alok sharma

23/04/2020

XLconnect R Package

XLConnect is a package that allows for **reading, writing and manipulating Microsoft Excel files** from within R.

- Advantages:
 - A platform-independent interface to Excel
 - It uses the Apache POI API as the underlying interface.
 - XLConnect allows you to produce formatted Excel{textcolor red} reports, including graphics, straight from within R.
 - This enables automation of manual formatting and reporting processes.
 - Reading and writing named ranges enables you to process complex inputs and outputs in an efficient way

Check my System Info

```
Sys.info()
```

##	sysname	release	version	nodename
##	"Windows"	"10 x64"	"build 18362"	"DESKTOP-590HM3L"
##	machine	login	user	effective_user
##	"x86-64"	"neelo"	"neelo"	"neelo"

Install the package in R studio

```
install.packages("XLconnect")  
library(XLconnect)
```

Initially I had Java version 13, which is not compatible so i a was getting this error (Figure 1)

```
knitr::include_graphics("error.JPG")
```

```
> library(XLConnect)
Error: package or namespace load failed for 'XLConnect':
.onload failed in loadNamespace() for 'XLConnect', details:
  call: fun(libname, pkgname)
  error: Installed java version 13.0.2+8 is not between Java>=8 and <=11! This is needed for this package
In addition: Warning message:
package 'XLConnect' was built under R version 3.6.3
```

Figure 1: Error: Wrong Java Version Installed

Check your R Version

R version

```
version
```

```
##
## platform      x86_64-w64-mingw32
## arch          x86_64
## os            mingw32
## system        x86_64, mingw32
## status
## major         3
## minor         6.3
## year          2020
## month         02
## day           29
## svn rev       77875
## language      R
## version.string R version 3.6.3 (2020-02-29)
## nickname      Holding the Windsock
```

- “mingw-w32” or “mingw-w64”
 - “mingw-w64” generate 64bit binaries that will run on windows natively (64bit windows required)
 - “mingw-w32” generate 32bit binaries that will run on windows natively

You can upgrade your R from Rstudio, if required

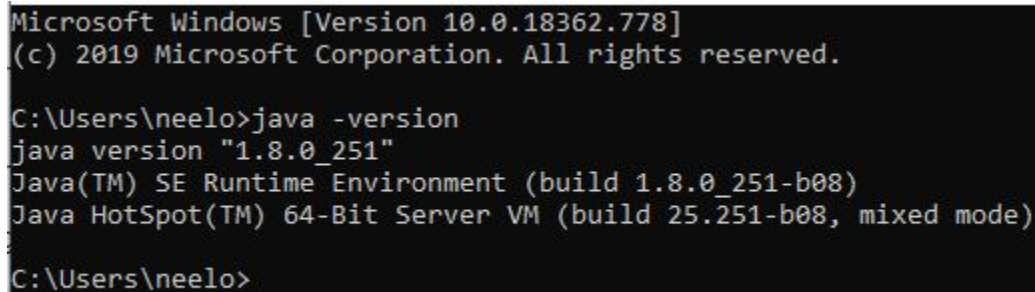

```
install.packages("installr")  
library(installr)  
updateR()
```

Check Your Java Version

A 64-bit program will see the information on 64-bit Java, and a 32-bit program will see information on 32-bit Java.

So make sure that you have Java SDK installed is of the same 64 or 32 bit as you R-program.

ON windows command line enter command `java -version` and it will tell you what you got for Java

```
Microsoft Windows [Version 10.0.18362.778]  
(c) 2019 Microsoft Corporation. All rights reserved.  
  
C:\Users\neelo>java -version  
java version "1.8.0_251"  
Java(TM) SE Runtime Environment (build 1.8.0_251-b08)  
Java HotSpot(TM) 64-Bit Server VM (build 25.251-b08, mixed mode)  
  
C:\Users\neelo>
```

If you require to install JAVA, Go Here!

JAVA_HOME env Variable is set right

After java is installed, make sure that the environment variable **JAVA_HOME** is set right Check by entering following command

```
Sys.getenv("JAVA_HOME")
```

```
## [1] "C:\\Program Files\\Java\\jdk1.8.0_251"
```

Make sure the variable value is set right by browsing to it
and if its value is not set Set it by entering following command

```
Sys.setenv(JAVA_HOME = "C:\\Program Files\\Java\\jdkx.x.x_xxx")
```

You are good to go If

- + R and Java are both 32 bit or 64 bit
- + Java version is between 8 and 11
- + JAVA_HOME Environment Variable is set right
